In my case I have to deal with large number of points (>10,000). Unfortunately, it does not scale well when the number of points increase. I tried to use the m-file and see how it deals with larger numbers of points. However, I get the following error: Number of nonlinear iterations exceeds the limit. I also tried to run the m-file with my input data using: > settrace() And I don't see any significant difference in the timings between my original code and my m-file. Is there a better way to solve this problem? Any help is appreciated. A: I tried to run the m-file with my input data using: > settrace() and I don't see any significant difference in the
